Technical Note 4

Project:	SBC Local Plan Support	**Prepared by:**	CEH
Project No.:	a100101	**Approved by:**	BM
Client:	Swindon Borough Council	**Status:**	Final
Subject:	Census Origin-Destination Review	**Date:**	May 2026

1.0 POLICY AND BEST PRACTICE REVIEW

1.1 Swindon Borough Council (SBC) has appointed arcitran to support with the Local Plan Transport Evidence Base. As part of this, arcitran has been commissioned to review existing travel patterns and develop trip distribution assumptions for the forecast year transport modelling. This Technical Note presents a review of Census travel to work origin-destination (OD) data, comparing the 2011 and 2021 datasets, and sets out the implications for the proposed approach to trip distribution.

1.2 2011 Census data was used in the development of the 2019 Strategic Transport Model and has historically provided the basis for understanding commuting patterns across the Swindon area. However, this dataset is now over a decade old and may not reflect current travel behaviour. The 2021 Census provides a more recent dataset, but was conducted during the COVID-19 pandemic when national lockdown restrictions were in place (Census Day was March 21st 2021).

1.3 This Technical Note therefore examines both datasets and considers the suitability of the 2021 data for informing trip distribution.

2.0 DATA SOURCES

Census Travel to Work Data

2.1 Both the 2011 and 2021 Census OD datasets were sourced from the Office for National Statistics Nomis website, using the WF01BEW dataset (2011) and ODWP01EW dataset (2021). The datasets record all usual residents aged 16 and over who were in employment in the week before the census, broken down by their location of residence and workplace.

2.2 The data was downloaded at three geographic levels for place of work: Local Authority District (LAD), Middle-layer Super Output Area (MSOA) and Output Area (OA). This allowed aggregation at different scales depending on the analysis required, with finer detail retained for local areas and broader groupings applied to more distant destinations.

COVID-19 and 2021 Census OD Data

2.3 The Office for National Statistics has identified travel to work as one of the topics most affected by the COVID-19 pandemic. The census fell during a period when a national lockdown was in place, with government guidance requiring people to work from home wherever possible, and up to 5.6 million people in England and Wales were supported by the furlough scheme.

2.4 The Office for National Statistics advises caution when using Census 2021 OD data for policy and planning purposes, noting that the data has limited utility in measuring pre or post-pandemic travel patterns in absolute terms.

2.5 However, for the purposes of this review, the analysis focuses on the relative distribution of commuting trips among those who were travelling to a fixed workplace, rather than on absolute trip volumes, mode of travel, or the proportion of home workers.

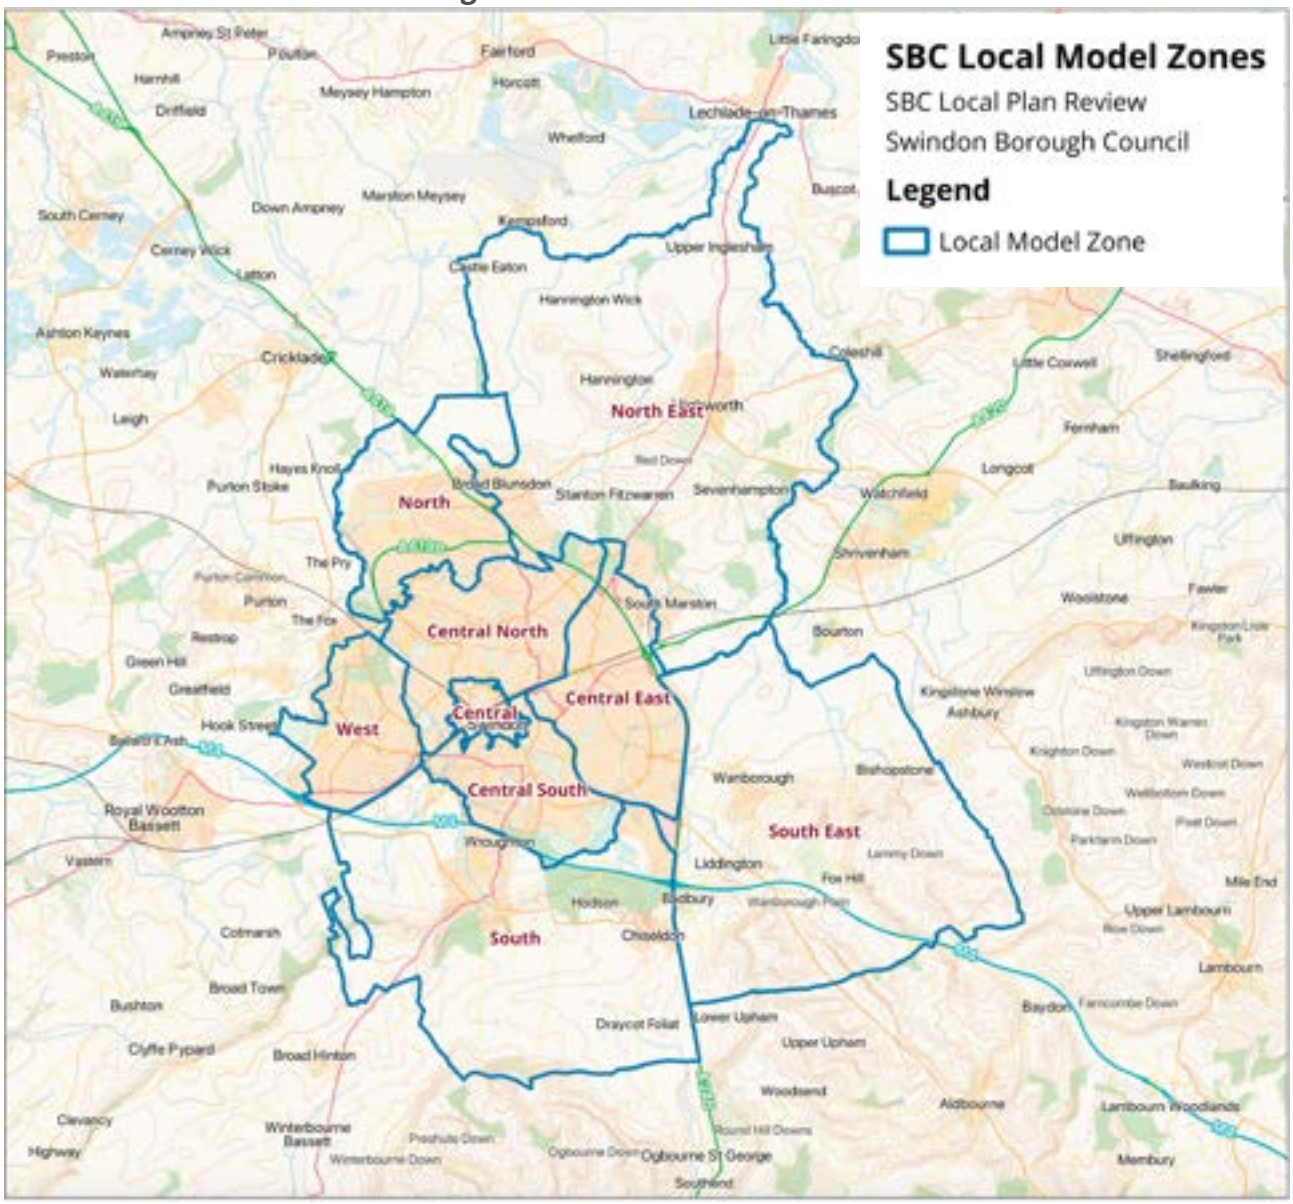

2.6 By examining where those who did commute were travelling to, the analysis is less exposed to the distortions introduced by the restrictions in place at the time. The key question is whether the pattern of destination choices changed between 2011 and 2021, rather than the overall volume of commuting.

3.0 METHODOLOGY

Assessment Areas

3.1 The SBC Local Model comprises nine zones which cover the SBC area (Central, Central East, Central North, Central South, North, North East, South, South East and West). Each Census OA in the census dataset was assigned to its corresponding Local Model Zone. The Local Model Zones are shown in **Figure 3.1**.

Figure 3.1 – Local Model Zones

Contains OS data © Crown copyright and database right (2026). OS OpenData is free to use under the Open Government Licence (OGL).

Destination Grouping

3.2 For each Local Model Zone, OD trip counts were aggregated by destination into the following groups, covering Swindon and each neighbouring local authority district:

- Swindon (subdivided by workplace Local Model Zone).
- Cotswold (by MSOA).
- West Oxfordshire (subdivided by MSOA).
- Vale of White Horse (subdivided by MSOA).
- West Berkshire (subdivided by MSOA).
- Wiltshire (subdivided by MSOA).
- Other Areas (all remaining LADs combined).

3.3 Destination shares were then calculated for each origin Local Model Zone, expressed as a percentage of the total number of commuters from that zone (excluding those categorised as 'mainly work at or from home', 'no fixed place', or 'does not apply'). This identifies the typical commute patterns of residents in each Local Model Zone.

Cleansing

3.4 A cleansing step was applied to remove destination LADs with very small trip counts (fewer than five trips from any given Local Model Zone), as these contribute negligible shares and may be subject to statistical disclosure control rounding in the ONS data.

3.5 In addition, trips where the origin and destination fall within the same Local Model Zone have been removed from this exercise. These intra-zonal trips are likely to represent commuter journeys made by active travel modes, as residents would be unlikely to drive across a Local Model Zone to reach a workplace within the same zone. Removing these trips has the effect of adding more trips to the wider model network rather than retaining trips within zones, which is both realistic and represents a robust assessment.

4.0 RESULTS

Central Zones

4.1 **Table 4.1** presents the 2021 trip distribution for the four central Local Model Zones, with the change from 2011 shown in brackets in percentage points.

Table 4.1 - Central Zones Trip Distribution

Zone	Swindon	Cotswold	West Oxfordshire	Vale of White Horse	West Berkshire	Wiltshire	Other Areas
Central	76.7% (+5.7)	1.9% (-0.2)	0.7% (+0.4)	1.3% (-1.9)	2.4% (+1.2)	11.0% (+1.5)	6.0% (-6.8)
Central East	68.7% (-2.4)	3.0% (+1.2)	1.5% (+0.6)	4.3% (+0.4)	3.3% (+0.6)	10.2% (+2.5)	9.1% (-3.0)
Central North	73.7% (+0.8)	3.0% (+1.1)	1.1% (+0.5)	2.9% (+0.1)	2.2% (+0.3)	9.9% (+0.8)	7.3% (-3.7)
Central South	75.3% (+3.9)	1.7% (+0.3)	0.8% (+0.3)	2.3% (-0.1)	2.3% (+0.5)	10.4% (+2.5)	7.2% (-7.3)

4.2 **Table 4.1** shows that the Central zone has the most pronounced increase in Swindon internal share (+5.7pp), rising to 76.7% in 2021. Central South also saw a notable increase

(+3.9pp). Central East, by contrast, saw a small decrease in internal share (-2.4pp), with corresponding gains to Cotswold (+1.2pp) and Wiltshire (+2.5pp). All four central zones saw reductions in the 'Other Areas' share, ranging from -3.0pp (Central East) to -7.3pp (Central South).

Outer Zones

4.3 **Table 4.2** presents the equivalent data for the five outer Local Model Zones.

Table 4.2 - Outer Zones Trip Distribution

Zone	Swindon	Cotswold	West Oxfordshire	Vale of White Horse	West Berkshire	Wiltshire	Other Areas
North	65.4% (+3.5)	5.5% (+1.4)	2.5% (+1.1)	3.1% (-0.1)	3.4% (+0.6)	9.9% (-0.1)	10.2% (-6.3)
North East	54.5% (-0.3)	8.0% (+1.8)	6.5% (+3.5)	10.8% (-1.1)	3.7% (+1.7)	7.4% (-0.7)	9.2% (-4.8)
South	65.4% (+2.7)	2.3% (+0.5)	1.5% (+1.2)	3.4% (+0.6)	3.8% (+0.3)	14.1% (+1.4)	9.5% (-6.7)
South East	61.0% (+1.3)	1.4% (+0.3)	2.6% (+2.1)	5.3% (+0.6)	7.9% (+2.7)	14.1% (+4.4)	7.7% (-11.4)
West	70.2% (+3.7)	2.4% (+0.5)	1.4% (+0.7)	2.7% (+0.6)	2.2% (-0.1)	13.7% (+0.8)	7.3% (-6.3)

4.4 The outer zones display a broadly similar pattern to the central zones, with reductions in the 'Other Areas' share in all cases. The South East zone shows the largest reduction (-11.4pp), with the reduction redistributing to Wiltshire (+4.4pp) and West Berkshire (+2.7pp), consistent with the zone's geographic position on the southern and eastern fringe of the borough.

4.5 The North East zone is notable for its relatively low Swindon internal share (54.5%) and its strong relationships with Vale of White Horse (10.8%) and Cotswold (8.0%), reflecting its rural character and proximity to these neighbouring authority areas. West Oxfordshire also gained significantly (+3.5pp), the largest gain of any destination for any zone.

Summary of Changes

4.6 **Table 4.3** summarises the average change in commuting destination share across all nine Swindon zones combined between 2011 and 2021.

Table 4.3 - Average Change in Commuting Destination Share, 2011 to 2021

Destination	2011 Share	2021 Share	Average Change (pp)
Swindon	65.8%	67.9%	+2.1
Cotswold	2.5%	3.2%	+0.8
West Oxfordshire	0.9%	2.1%	+1.2
Vale of White Horse	4.1%	4.0%	-0.1
West Berkshire	2.6%	3.5%	+0.9
Wiltshire	9.7%	11.2%	+1.5
Other Areas	14.4%	8.2%	-6.3

4.7 The dominant change across all zones is the reduction in the 'Other Areas' share, averaging approximately 6 percentage points. The Swindon internal share increased by +2.1pp on average, while among neighbouring authorities, Wiltshire saw the largest gain (+1.5pp), followed by West Oxfordshire (+1.2pp), West Berkshire (+0.9pp) and Cotswold (+0.8pp). The Vale of White Horse showed negligible change (-0.1pp on average).

5.0 REVIEW

Suitability of 2021 Census Data

5.1 As noted in Section 2, the ONS has identified travel to work as one of the topics most affected by the pandemic in the 2021 Census. The principal concerns relate to the increase in home working (from 10.3% to 31.2%), the effect of the furlough scheme on how respondents completed the workplace questions, and the overall representativeness of commuting patterns observed during lockdown.

5.2 The analysis presented in this note focuses on the relative distribution of trips among those who did report travelling to a fixed workplace, rather than on the overall volume or mode of commuting. This distinction is important, but it does not fully insulate the results from pandemic effects. The increase in home working and furlough was not uniform across occupations or industries. Workers in roles that could not be performed remotely (e.g. healthcare, retail, manufacturing, logistics) were more likely to continue travelling to a workplace during lockdown, while those in office-based roles with more distant commutes (e.g. to London or other major centres) were more likely to be working from home. This effect could skew the 2021 destination shares towards more local destinations, even among those who did report a fixed workplace.

5.3 The observed reduction in the 'Other Areas' share and the corresponding gains by Swindon and neighbouring authorities are therefore ambiguous. They could reflect:

- A genuine structural shift in commuting geography over the decade, driven by changes in the local economy, new development, and evolving working patterns.
- A pandemic-induced distortion, whereby longer-distance commuters were disproportionately absent from the 2021 dataset.
- A combination of the two, with a real underlying trend amplified by the pandemic effect.

5.4 The consistency of the pattern across all nine LMZs does not, on its own, distinguish between these explanations. A pandemic effect driven by occupation type and commute distance would be expected to apply systematically across all zones, producing precisely the kind of uniform shift observed in the data.

5.5 Despite this, it is reasonable to assume that some element of the observed shift is structural rather than solely pandemic-related. The growth of home working and flexible working arrangements has persisted beyond the pandemic, and national evidence suggests a sustained reduction in longer-distance commuting.

5.6 To the extent that the 2021 Census captures this shift, the data may be more representative of current commuting patterns than the 2011 data. However, the magnitude of the shift (averaging 6pp for 'Other Areas') is likely to overstate the true structural change, given the pandemic conditions under which the data were collected.

Comparison with 2011 Data

5.7 The 2011 Census data, while not affected by pandemic conditions, is now over a decade old. In the intervening period, Swindon has seen substantial development, changes to the local economy, and the broader shifts in working patterns described previously. Using 2011 distributions to inform a model with a 2023 base year and forecast years extending to 2043 would introduce its own form of uncertainty, as the data would not reflect any changes in commuting behaviour that have occurred since 2011.

5.8 Neither dataset is ideal. The 2011 data is unaffected by the pandemic but is dated. The 2021 data is more recent but carries the caveats set out above. The choice between them is therefore a judgement about which source of uncertainty is more manageable in the context of the modelling.

Implications for Trip Distribution

5.9 The purpose of this review is to inform the trip distribution assumptions for the forecast year modelling. The destination shares derived from the census data would be applied to the zone-level trip generation outputs to produce distributed trip matrices to inform the forecast year distribution assumptions.

5.10 There is also a practical modelling consideration that the 2021 distributions direct a greater proportion of trips to destinations within or close to the core model area, where the SATURN simulation network has the greatest level of detail. This places more demand on the corridors and junctions where the model outputs are most relied upon for scheme testing and Local Plan evidence. By contrast, the 2011 distributions would assign a larger share of trips to the periphery of the model area, where the buffer network has less granularity and the assignment outputs are less informative. From this perspective, adopting the 2021 distributions represents a more demanding test of the local network.

5.11 It is considered that the 2021 Census data provides a more robust dataset for informing trip distribution than the 2011 data, subject to the caveats set out. The destination shares derived from the 2021 data reflect a more contemporary picture of commuting geography, even accounting for the likelihood that the pandemic has amplified some of the observed trends.

6.0 PROPOSED TRIP DISTRIBUTIONS FOR USE

6.1 Based on the analysis presented in this Technical Note, **Table 6.1** sets out the proposed trip distribution percentages for each Local Model Zone, derived from the 2021 Census OD data. **Table 6.1**presents a summary of the destination shares; the full breakdown for each zone is provided in **Appendix A**.

6.2 It is proposed that these destination shares are applied to the Local Plan allocations to produce distributed trip matrices for the forecast year modelling.

Table 6.1 - Proposed Trip Distribution by Local Model Zone (%)

Local Model Zone	Swindon	Cotswold	West Oxfordshire	Vale of White Horse	West Berkshire	Wiltshire	Other Areas
Central	72.7%	2.2%	0.8%	1.5%	2.9%	12.9%	7.1%
Central East	48.5%	4.9%	2.4%	7.1%	5.4%	16.8%	14.9%
Central North	65.8%	4.0%	1.5%	3.7%	2.8%	12.8%	9.5%
Central South	71.8%	1.9%	0.9%	2.6%	2.6%	11.9%	8.2%
North	61.7%	6.1%	2.8%	3.5%	3.7%	10.9%	11.3%
North East	38.4%	10.8%	8.8%	14.6%	4.9%	10.0%	12.5%
South	60.4%	2.6%	1.8%	3.9%	4.4%	16.1%	10.8%
South East	50.9%	1.7%	3.2%	6.7%	10.0%	17.7%	9.7%
West	63.1%	3.0%	1.7%	3.4%	2.7%	17.0%	9.1%

6.3 The distributions in **Table 6.1** are recommended for adoption in the forecast year modelling, subject to SBC review and approval.

7.0 SUMMARY AND CONCLUSION

Summary

7.1 This Technical Note has reviewed Census travel to work OD data from 2011 and 2021, comparing trip distribution shares for each of the nine Swindon Local Model Zones. The analysis found that the share of commuting trips to destinations outside Swindon and its immediate neighbouring authorities ('Other Areas') fell by approximately 6 percentage points on average between 2011 and 2021, with corresponding gains to Swindon (+2.1pp) and neighbouring authorities including Wiltshire (+1.5pp) and West Oxfordshire (+1.2pp). The Vale of White Horse showed negligible change. These trends are consistent across all nine zones.

7.2 **Section 6** sets out the proposed trip distributions for use in the forecast year modelling, derived from the cleansed 2021 Census data with intra-zonal trips removed.

7.3 However, the 2021 Census was conducted during the COVID-19 pandemic, and the ONS advises caution when using the travel to work data for planning purposes. The focus of this analysis on relative destination shares, rather than absolute commuting volumes, reduces but does not eliminate the risk of pandemic-related distortions. The observed shift is likely to reflect a combination of genuine structural change and a pandemic effect, with the impact of the pandemic potentially exaggerating any structural change.

Conclusion

7.4 Neither the 2011 nor the 2021 Census dataset is without limitation. The 2011 data is unaffected by the pandemic but is now over a decade old and does not reflect changes in commuting behaviour that have occurred in the intervening period. The 2021 data is more recent but carries the caveats set out in this note. On balance, the 2021 Census distributions are considered to provide a more defensible basis for informing trip distribution in the forecast year modelling, with the 2011 data retained as a comparison for sensitivity testing.

Next Steps

7.5 It is recommended that SBC review and approve the proposed approach to trip distribution before the 2021 Census destination shares are applied in the forecast year modelling.
